redAcademy

THE CAREER ACCELERATOR

PRACTICAL LOGBOOK

Fundamentals of JavaScript

Scripting and Front-End Basics

Programme Details
Skills Programme: JavaScript Programmer Programme Code: SP-220373 NQF Level: 4 Credits: 60 Practical Modules Covered: PM-01 to PM-04

Learner full name	Ryan Christopher Ward
ID / passport number	9908185110082
Employer / department	Development Operations Support Analyst - LDS
Cohort / intake	Group 1
Facilitator	Mr Mahomed H. G Nabee
Assessor	Mr Mahomed H. G Nabee
Start date	2026/08/21
Completion date	2026/10/22

Purpose and Use of this Logbook

This logbook records the learner's completion of the practical modules in the JavaScript Programmer Skills Programme. It provides a structured record of practical activities, evidence produced, learner reflections, facilitator observations, assessment decisions, corrective actions and final sign-off.

Important Quality Note

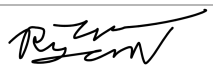

This logbook is designed to align with QCTO occupational learning principles for practical learning, internal assessment, evidence collection and competency recording. It must be used together with the registered curriculum, the provider's assessment instruments, moderation requirements and applicable QCTO/SETA instructions. It does not replace any official curriculum or assessment specification.

Roles and Responsibilities

Role	Responsibility
Learner	Complete activities honestly, retain authentic evidence, reflect on learning, respond to feedback and obtain signoff.
Facilitator / Mentor	Guide practice, observe performance, provide developmental feedback and verify participation.
Assessor	Judge evidence against the stated criteria, record competent or not-yet-competent decisions and specify corrective action.
Moderator / Quality Reviewer	Check that assessment decisions are fair, valid, reliable, consistent and supported by evidence.
Employer / Workplace Representative	Where applicable, confirm workplace relevance, attendance and authenticity of activities performed.

Learner Declaration

I declare that the work recorded in this logbook is my own, except where collaboration or external assistance is clearly acknowledged. I understand that copied, fabricated or misleading evidence may be rejected and may be managed according to the provider's assessment and disciplinary procedures.

Learner name	Ryan Christopher Ward
Learner signature	
Date	2026/08/22
Facilitator witness	
Witness signature	

Assessment Appeals and Reassessment

A learner who is assessed as Not Yet Competent should receive clear feedback and a reasonable opportunity to correct gaps or complete reassessment according to the provider's assessment policy. Assessment appeals must follow the provider's formal appeals process.

Evidence Rules

- ☐ Evidence must be valid: it must relate directly to the practical task and criteria.
- ☐ Evidence must be authentic: it must be the learner's own work.
- ☐ Evidence must be current: it must demonstrate present competence.

- ☐ Evidence must be sufficient: enough evidence must be available to support the decision.
- ☐ Files should be named clearly and retained in the learner's portfolio or LMS submission area.
- ☐ Screenshots should show the relevant output, date/context where possible, and not expose confidential customer data.
- ☐ GitHub evidence should include meaningful commits and, where required, branch or pull-request evidence.

Programme Practical Module Map

Module	Title	Credits	Main practical output
PM-01	**JavaScript Programming Fundamentals**	6	Set up tools; create first HTML/CSS/JS page; use browser tools and GitHub.
PM-02	**Programme with JavaScript**	6	Apply variables, data types, operators, conditions, functions, arrays and loops.
PM-03	**Intermediate Programming with JavaScript**	12	Apply debugging, validation, DOM manipulation, events and basic API communication.
PM-04	**Projects with JavaScript**	12	Plan, build, test, document and present one integrated browser-based project.

Overall Practical Evidence Register

Evidence No.	Module	Description	File / link	Date	Verified by

Evidence No.	Module	Description	File / link	Date	Verified by

PM-01: JavaScript Programming Fundamentals

Module Purpose
To set up and use the basic tools required for browser-based JavaScript development, create a first interactive page and demonstrate basic Git/GitHub version control.

Activity 1.1: Development Environment and Project Structure

Purpose of the Activity
Create and verify a working beginner JavaScript development environment.

Instructions to the learner

1. ☑ Create a clearly named project folder.
2. ☑ Create index.html, style.css and script.js.
3. ☑ Open the folder in VS Code.
4. ☑ Connect the CSS and JavaScript files correctly.
5. ☑ Run the page in Chrome or Edge.
6. ☑ Open browser Developer Tools and identify the Console and Elements tabs. **Required evidence**

7. ☑ Screenshot of the project folder and VS Code file structure.
8. ☑ Screenshot of the page running in the browser.
9. ☑ Screenshot of Developer Tools with a console message.
10. ☑ The three source files. **Competency criteria**

11. ☑ Correct folder and file structure.
12. ☑ Files are linked correctly.
13. ☑ Page loads without blocking errors.
14. ☑ Learner can explain the role of HTML, CSS and JavaScript.

Learner Activity Record

Date started	2026/08/21
Date completed	2026/08/22
Location / platform	RedPanda Software
Time spent (hours)	2 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 01\evidence
Challenges experienced	None
How challenges were resolved	

Learner Reflection

What did you complete in this activity?

Setting up a basic webpage with a HTML, CSS and JS file in one folder. At the end the webpage has a short description with a working button and two pop up messages.

Which JavaScript concepts did you apply?

Add behaviour that allowed the users to click with button and receive a pop-up message. On the back end there is 2 console log messages that write with the page is loaded and that the user has clicked the button.

What worked well?

What worked best for was that VS auto fills in the brackets and quotes.

_ What error or difficulty did you encounter?

Ran into an issue where the console on Chroma was not picking up the JS script due to incorrect spelling and missing ';'

How would this skill be useful in a retail or workplace environment?

This skill will be usually to allow people to create simple webpages that can allow user interaction with the page.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Correct folder and file structure.	☐	☐	
Files are linked correctly.	☐	☐	
Page loads without blocking errors.	☐	☐	
Learner can explain the role of HTML, CSS and JavaScript.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	

Date	
Learner acknowledgement and signature	

Activity 1.2: My First Interactive Web Page

Purpose of the Activity
Build a simple page introducing the learner or department and add basic interaction.

Instructions to the learner

- ☑ Add a heading and short paragraph.
- ☑ Apply basic CSS styling.
- ☑ Add a button.
- ☑ Use JavaScript to show an alert when the button is clicked.
- ☑ Write a meaningful console.log() message.
- ☑ Use comments and neat indentation. **Required evidence**

- ☑ HTML, CSS and JavaScript files.
- ☑ Screenshot before and after interaction.
- ☑ Screenshot of console output.
- ☑ Short explanation of the code. **Competency criteria**

- ☑ Page contains required HTML content.
- ☑ CSS improves readability.
- ☑ Button interaction works.
- ☑ Code is readable and commented.

Learner Activity Record

Date started	2026/08/22
Date completed	2026/08/22
Location / platform	RedPanda Software
Time spent (hours)	4 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 01\evidence
Challenges experienced	None
How challenges were resolved	Double checked spelling when it came to file names.

Learner Reflection

What did you complete in this activity?

Setting up a basic webpage with a HTML, CSS and JS file in one folder. At the end the webpage has a short description with a working button and two pop up messages.

_____

Which JavaScript concepts did you apply?

Add behaviour that allowed the users to click with button and receive a pop-up message. On the back end there is 2 console log messages that write with the page is loaded and that the user has clicked the button.

What worked well?

What worked best for was that VS auto fills in the brackets and quotes.

What error or difficulty did you encounter?

Ran into an issue where the console on Chroma was not picking up the JS script due to incorrect spelling and missing ';'

How would this skill be useful in a retail or workplace environment?

This skill will be usually to allow people to create simple webpages that can allow user interaction with the page.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Page contains required HTML content.	☐	☐	
CSS improves readability.	☐	☐	
Button interaction works.	☐	☐	
Code is readable and commented.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	
Learner acknowledgement and signature	

Activity 1.3: Git and GitHub Basics

Purpose of the Activity
Create a repository and record the development history.

Instructions to the learner

- ☑ Create a GitHub repository.
- ☑ Add the project files.
- ☑ Create at least three meaningful commits.
- ☑ Create a branch and make one change.
- ☑ Push the branch and open a basic pull request, where required.
- ☑ Use clear commit messages. **Required evidence**

- ☑ Repository link.
- ☑ Screenshot of commit history.
- ☑ Screenshot of branch or pull request.
- ☑ README or project description. **Competency criteria**

- ☑ Repository contains correct files.
- ☑ Commit history shows progressive work.
- ☑ Branching evidence is present.
- ☑ Learner can explain Git versus GitHub.

Learner Activity Record

Date started	2026/08/23
Date completed	2026/08/23
Location / platform	RedPanda Software
Time spent (hours)	2 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 01\evidence
Challenges experienced	None
How challenges were resolved	

Learner Reflection

What did you complete in this activity?

I completed my basic webpage of my team department and was able to make commits, push and create a branch from Git commands.

Which JavaScript concepts did you apply?

I applied more alert messages and console.log() showing messages if a button was clicked. Also added a function to the button to show different text and change the colour when clicked.

What worked well?

Being able to run all my git commands in the Visual Studio built in terminal.

_ What error or difficulty did you encounter?

No errors or difficulties where experienced during this activity

How would this skill be useful in a retail or workplace environment?

The department I work in uses things like repo, git commands and Visual studio every day. Things like branches are good practice as it can allow the user to make and test any changes without affecting the main branch until the pull request is sent.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Repository contains correct files.	☐	☐	
Commit history shows progressive work.	☐	☐	
Branching evidence is present.	☐	☐	
Learner can explain Git versus GitHub.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	
Learner acknowledgement and signature	

PM-02: Programme with JavaScript

Module Purpose
To apply JavaScript syntax and programming fundamentals in small exercises and a Support Ticket Priority Checker.

Activity 2.1: Variables, Data Types and Operators

Purpose of the Activity
Capture and calculate workplace or retail information using variables and operators.

Instructions to the learner

- ☑ Declare values using let and const.
- ☑ Use strings, numbers and Booleans.
- ☑ Perform arithmetic calculations such as totals, VAT or quantities.
- ☑ Use comparison and logical operators.
- ☑ Output results to the console or page.
- ☑ Add comments explaining the code. **Required evidence**

- ☑ JavaScript exercise file.
- ☑ Screenshot of at least three outputs.
- ☑ Short explanation identifying each data type and operator used. **Competency criteria**

- ☑ Variables are named meaningfully.
- ☑ Data types match the values stored.
- ☑ Calculations are correct.
- ☑ Outputs are clear and code is readable.

Learner Activity Record

Date started	2026-08-31
Date completed	2026-08-31
Location / platform	RedPanda Software
Time spent (hours)	5 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 02\pm-02-ticket-checker\evidence
Challenges experienced	None
How challenges were resolved	

Learner Reflection

What did you complete in this activity?

Understanding snystax and readability in JavaScript code. Knowing the difference between values And knowing that if the syntax is wrong, it will cause the JavaScript to break.

Which JavaScript concepts did you apply?

I applied concepts like const that is a value or item that cannot be changed, as well as adding let which is a value or item that change. Applying the concept of variables as they needed to add in the begin of any JavaScript.

What worked well?

What worked well for me was understanding the difference between a String or text in other words and number. That fact that a 10 can be used as a string but will function as a number as JavaScript will pick it up as a String “10”.

What error or difficulty did you encounter?

No errors were encountered in this part of the module.

How would this skill be useful in a retail or workplace environment?

A system can be used to track and add items. Once items get selected it will add the subtotal and a final amount with VatRate added.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Variables are named meaningfully.	☐	☐	
Data types match the values stored.	☐	☐	
Calculations are correct.	☐	☐	
Outputs are clear and code is readable.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	

Learner acknowledgement and signature	

Activity 2.2: Conditions and Functions

Purpose of the Activity
Use reusable logic to make decisions.

Instructions to the learner

- ☑ Write if, else if and else logic.
- ☑ Use a switch statement in one exercise.
- ☑ Create a function with parameters.
- ☑ Return a value from a function.
- ☑ Test normal and edge-case inputs.
- ☑ Document the purpose of each function. **Required evidence**

- ☑ JavaScript source file.
- ☑ Screenshots showing different decision outcomes.
- ☑ Test table with expected and actual outcomes. **Competency criteria**

- ☑ Conditions produce correct outcomes.
- ☑ Function is called correctly.
- ☑ Return value is used meaningfully.
- ☑ At least three test cases are recorded.

Learner Activity Record

Date started	2026-08-31
Date completed	2026-09-01
Location / platform	RedPanda Software
Time spent (hours)	5 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 02\pm-02-ticket-checker\evidence
Challenges experienced	Understanding functions
How challenges were resolved	Practice through the PM-02 Practice Exercises

Learner Reflection

What did you complete in this activity?

Understood that the purpose of Functions and that there can be variable inside of a function or outside but still calls for it. Functions help by not needed to rewrite the same code over. The if statement where there can be more than one possible outcome.

Which JavaScript concepts did you apply?

I applied JavaScript functions like if, if else, else, return, functions and variables like === which means the variable must equal the same. And variables like && which adds on to an existing

variable.

What worked well?

What worked well was the if statement. They are nice to work with as the outcome will be different if the variable matches or does not.

What error or difficulty did you encounter?

The issue I dealt with the most here was understanding the layout of how a function needs to be built/layout.

How would this skill be useful in a retail or workplace environment?

A script can be created where a user needs to entry their password and the response can either be that that the password is correct, be updated or incorrect.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Conditions produce correct outcomes.	☐	☐	
Function is called correctly.	☐	☐	
Return value is used meaningfully.	☐	☐	
At least three test cases are recorded.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	
Learner acknowledgement and signature	

Activity 2.3: Arrays, Loops and Support Ticket Priority Checker

Purpose of the Activity
Process multiple tickets and assign appropriate priority messages.

Instructions to the learner

- ☑ Create an array of ticket priorities or ticket objects.
- ☑ Loop through all records.
- ☑ Use a function to determine the message for High, Medium and Low priority.
- ☑ Show the result in the console or page.
- ☑ Handle unexpected or missing priority values.
- ☑ Maintain a meaningful GitHub commit history. **Required evidence**

- ☑ Completed Support Ticket Priority Checker files.
- ☑ Screenshots showing High, Medium, Low and invalid outcomes.
- ☑ GitHub repository and commit history.
- ☑ Short reflection on variables, functions, arrays, loops and conditions. **Competency criteria**

- ☑ All required priority outcomes work.
- ☑ Array and loop process multiple items.
- ☑ Function and conditions are correctly structured.
- ☑ Unexpected input is handled clearly.

Learner Activity Record

Date started	2026-09-01
Date completed	2026-09-01
Location / platform	RedPanda Software
Time spent (hours)	4 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 02\pm-02-ticket-checker\evidence
Challenges experienced	Understanding functions
How challenges were resolved	Practice through the PM-02 Practice Exercises

Learner Reflection

What did you complete in this activity?

I was able to complete the understanding an Array which can contain a list. Understanding that index can start counting from 0. Understanding that comments are needed in even though the code does work, as comments help developers to understand the code more easily. Also understand loop that can repeat actions

---

Which JavaScript concepts did you apply?

I used concepts like .push() in an Array to add items. Add concepts like .shift() and .pop() that can remove items from an Array. For loops that is used to repeat for a specific number of times. While loop that is used to repeat the code as well as the condition remains true. For Each() which is an Array method that runs a function for each item in the array.

What worked well?

Understand the importance of comments and making code readable.

What error or difficulty did you encounter?

The issue I dealt with the most here was understanding the layout of how a function needs to be built/layout.

How would this skill be useful in a retail or workplace environment?

A developer can create a script that can continuously check the status of a server and send an alert to the necessary department if the services is struggling or has stopped running.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
All required priority outcomes work.	☐	☐	
Array and loop process multiple items.	☐	☐	
Function and conditions are correctly structured.	☐	☐	
Unexpected input is handled clearly.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	
Learner acknowledgement and signature	

PM-03: Intermediate Programming with JavaScript

Module Purpose
To apply debugging, validation, DOM manipulation, browser events, error handling and basic REST API communication.

Activity 3.1: Debugging and Error Handling

Purpose of the Activity

Find and correct JavaScript errors using systematic troubleshooting.

Instructions to the learner

- ☑ Open and read browser console errors.
- ☑ Use console.log(), console.warn() and console.error() appropriately.
- ☑ Use a breakpoint and step through code.
- ☑ Correct at least three seeded errors.
- ☑ Use try...catch for a controlled error example.
- ☑ Record the original error, cause and fix. **Required evidence**

- ☑ Before-and-after screenshots.
- ☑ Debugging record for at least three errors.
- ☑ Corrected code.
- ☑ Screenshot of breakpoint or Sources panel. **Competency criteria**

- ☑ Learner identifies relevant error details.
- ☑ Fix addresses the root cause.
- ☑ try...catch is used appropriately.
- ☑ Debugging record is clear and reproducible.

Learner Activity Record

Date started	2026/09/15
Date completed	2026/09/27
Location / platform	RedPanda SoftWare
Time spent (hours)	2-3 hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 03\pm03-contact-form\evidence
Challenges experienced	Difficulty with finding the errors and understanding why the code would not work.
How challenges were resolved	

Learner Reflection

What did you complete in this activity?

I found and fixed three seeded JavaScript errors and tested the corrected code. I also used try..catch to handle an error.

_____

Which JavaScript concepts did you apply?

I applied event handling, DOM manipulation, console debugging, breakpoints, try…catch, and error handling.

_____

What worked well?

Using the browser console and console.log() helped to see what the code was doing and identify where the problem occurred.

What error or difficulty did you encounter?

Encountered errors caused by incorrect or missing code.

How would this skill be useful in a retail or workplace environment?

Debugging helps identify and fix software problems quickly, reducing system downtime and helping business applications work correctly for the users and customers.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Learner identifies relevant error details.	☐	☐	
Fix addresses the root cause.	☐	☐	
try...catch is used appropriately.	☐	☐	
Debugging record is clear and reproducible.	☐	☐	

Overall result: Competent / Not Yet Competent	
Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	

Date	
Learner acknowledgement and signature	

Activity 3.2: Department Contact Form with Validation

Purpose of the Activity
Build and validate an interactive workplace contact form.

Instructions to the learner

- ☑ Create fields for name, department, email, issue category and message.
- ☑ Prevent submission when required data is missing.
- ☑ Check that the email format is reasonable.
- ☑ Display specific error messages.
- ☑ Display a success message for valid input.
- ☑ Use DOM methods and a submit event listener.
- ☑ Test valid, invalid and boundary cases. **Required evidence**

- ☑ HTML, CSS and JavaScript files.
- ☑ Screenshots of missing-field, invalid-email and successful submission states.
- ☑ Completed test table. ☐ GitHub commits. **Competency criteria**

- ☑ All required fields are checked.
- ☑ Invalid email is rejected with helpful feedback.
- ☑ Valid input produces a success state.
- ☑ DOM updates and event handling work correctly.

Learner Activity Record

Date started	2026/09/15
Date completed	2026/09/27
Location / platform	RedPanda SoftWare
Time spent (hours)	2-3 Hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 03\pm03-contact-form\evidence
Challenges experienced	Form Submissions Control: Managing the default browser behaviour, where unvalidated form submissions would instantly reload the page and erase user input.
How challenges were resolved	Event Prevention Management: Utilized JavaScript's event.preventDefault() within a submit event listener to pause default submission until all fields pass validation checks.

Learner Reflection

What did you complete in this activity?

Built an interactive workplace contact form using HTML, CSS, and JavaScript. The form collects user details like Name, Department, Email, Issue Category and Message. Page validates the inputs dynamically before allowing submissions.

Which JavaScript concepts did you apply?

DOM Manipulation: Selecting elements using methods to alter text/styles to display errors or success messages.

Event Handling: Adding an addEventListener to listen for the form's submit event and using event.preventDefault() to stop automatic page reloads.

Conditional Logic & Regular Expressions (RegEx): Using if/else statements to check for missing inputs and applying RegEx to check if the email format is valid.

What worked well?

The event listener effectively intercepted form submissions, allowing real-time feedback.

Dynamically updating the DOM meant users received clear, immediate error messages next to invalid fields without needing to refresh the page.

What error or difficulty did you encounter?

Page Refreshing: Initially, submitting the form caused the page to reload instantly, clearing all user inputs before validation could run.

Regex Validation: Creating a pattern for email validation that correctly flagged invalid emails without breaking on valid ones.

How would this skill be useful in a retail or workplace environment?

Form validation ensures that customer inquiries, internal support tickets, or feedback submissions are captured accurately without missing key information (like an email address).

This saves time, prevents database clutter with broken entries, and improves overall communication efficiency in a business setting.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
All required fields are checked.	☐	☐	
Invalid email is rejected with helpful feedback.	☐	☐	
Valid input produces a success state.	☐	☐	
DOM updates and event handling work correctly.	☐	☐	

Overall result: Competent / Not Yet Competent	

Assessor / facilitator name	Mr Mahomed H. G Nabee
Signature	
Date	
Learner acknowledgement and signature	

Activity 3.3: DOM Events and Dynamic Content

Purpose of the Activity
Read and change page elements in response to user actions.

Instructions to the learner

- ☑ Select elements by ID or query selector.
- ☑ Change text or styles.
- ☑ Add and remove an item dynamically.
- ☑ Respond to click, input or change events.
- ☑ Use event.preventDefault() where appropriate.
- ☑ Keep the interface clear and usable. **Required evidence**

- ☑ Source files.
- ☑ Screenshots showing dynamic changes.
- ☑ Short explanation of selectors and events used. **Competency criteria**

- ☑ Correct elements are selected.
- ☑ Events trigger expected changes.
- ☑ Add/remove behaviour works.
- ☑ Code is organised and readable.

Learner Activity Record

Date started	2026/09/15
Date completed	2026/09/27
Location / platform	RedPanda Software
Time spent (hours)	2-3 Hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 03\pm03-contact-form\evidence
Challenges experienced	Targeting Correct Elements: Missing or mistyping ID and class naming conventions in querySelector, leading to null reference errors when attempting to select HTML elements

How challenges were resolved	Precise structured Strategies: Implemented checks utilizing explicit getElementById and structured queryselector syntax to guarantee accurate targeting.

Learner Reflection

What did you complete in this activity?

I built an interactive web page that reads and updates content in real time based on user actions like clicks and text input.

I added functionality to dynamically add and remove list items, update styles, and modify text content without reloading the page.

Which JavaScript concepts did you apply?

DOM Selection: Used methods like document.getElementById() and document.querySelector() to find and manipulate elements.

Event Listeners: Used addEventListener() to detect user interactions such as click, input, and change events.

Dynamic DOM Manipulation: Used createElement(), appendChild(), and remove() to add or delete elements on the fly.

What worked well?

_Using addEventListener() allowed the page to feel fast and responsive.

Updating text content and toggling styles directly through JavaScript provided immediate feedback whenever a user interacted with the page.

What error or difficulty did you encounter?

Element Selection Errors: Getting null errors when attempting to select HTML elements using slightly incorrect ID or selector names.

Event Behavior Issues: Buttons submitting data prematurely before event.preventDefault() was properly implemented.

How would this skill be useful in a retail or workplace environment?

Dynamic DOM manipulation is essential for creating interactive workplace tools like digital shopping carts, task tracking lists, or inventory management dashboards.

It allows staff or customers to add, update, or remove items in real time, keeping the interface clean and user-friendly without unnecessary page reloads.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Correct elements are selected.	☐	☐	
Events trigger expected changes.	☐	☐	

Add/remove behaviour works.	☐	☐	
Code is organised and readable.	☐	☐	

Overall result: Competent / Not Yet Competent

Activity 3.4: Display Data from an API

Purpose of the Activity
Retrieve and display simple data from a public or mock API.

Instructions to the learner

- ☑ Use fetch() to send a GET request.
- ☑ Convert the response to JSON.
- ☑ Display selected fields on the page.
- ☑ Show a loading or status message.
- ☑ Handle a failed request with catch or try...catch.
- ☑ Do not expose confidential credentials or customer information. **Required evidence**

- ☑ HTML, CSS and JavaScript files.
- ☑ Screenshot of API data displayed.
- ☑ Screenshot of error-handling output or simulated failure.
- ☑ Short explanation of request, response and JSON. **Competency criteria**

- ☑ Request retrieves data successfully.
- ☑ JSON fields are displayed clearly.
- ☑ Failure is handled without crashing the page.
- ☑ Learner can explain the purpose of an API.

Learner Activity Record

Date started	2026/09/15
Date completed	2026/09/27
Location / platform	RedPanda Software
Time spent (hours)	2-3 Hours

GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM 03\pm03-contact-form\evidence
Challenges experienced	Asynchronous Execution Flaws: Forgetting that the network requests take time, leading to attempts to read of display the API data before the fetch() promise had fully resolved.
How challenges were resolved	Structured Promise Chains: Implemented sequential .then() blocks and clean conversion methods to ensure incoming responses were fully converted to JSON before data processing

Learner Reflection

What did you complete in this activity?

I retrieved data from a public/mock API using JavaScript and dynamically displayed selected JSON fields on a web page.

I also added status/loading indicators and error-handling routines so the application handles successful and failed network requests gracefully.

Which JavaScript concepts did you apply?

Fetch API (fetch()): Sent asynchronous GET requests to an external API endpoint to fetch raw data.

Promises & JSON Parsing: Converted the raw API response stream into readable JSON objects using .json().

Asynchronous Control (try...catch): Managed network outcomes and errors using try...catch blocks to prevent app crashes.

DOM Data Rendering: Injected specific JSON fields dynamically into targeted HTML elements.

What worked well?

Displaying a loading message immediately provided a responsive user experience while the request was in progress.

Converting the API response straight into JSON made extracting and rendering specific fields straightforward.

What error or difficulty did you encounter?

Unresolved Promises / Syntax Errors: Forgetting to await the .json() conversion step, which returned an empty Promise object instead of actual data.

Unchecked HTTP Errors: Learning that fetch() doesn't automatically reject HTTP error statuses (like 404 or 500), requiring manual checks on response.ok.

How would this skill be useful in a retail or workplace environment?

Fetching data from APIs allows web applications to display real-time information—such as live product inventory, customer profile data, pricing updates, or order tracking information—directly from a central workplace database without needing manual page updates.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Request retrieves data successfully.	☐	☐	
JSON fields are displayed clearly.	☐	☐	
Failure is handled without crashing the page.	☐	☐	
Learner can explain the purpose of an API.	☐	☐

PM-04: Projects with JavaScript

Module Purpose
To consolidate the programme through one complete beginner-friendly workplace web application using HTML, CSS, JavaScript and GitHub.

Approved Project Selection

The learner must select and complete ONE of the following project options:

- ☐ Option 1: Helpdesk Ticket Logger
- ☑ Option 2: Department Resource Request Form
- ☐ Option 3: Basic Calculator or Leave Days Calculator
- ☐ Option 4: Mini Quiz Application

Selected option	Option 2: Department Resource Request Form
Reason for selecting this option	This project could be something useful for quick ticket logging.
Facilitator approval	
Approval date	

Activity 4.1: Project Planning and Design

Purpose of the Activity
Define a clear, achievable project before development starts.

Instructions to the learner

- ☑ Write a short problem statement and target user description.
- ☑ List functional requirements.
- ☑ Draw a simple page sketch or wireframe.
- ☑ Identify variables, arrays or objects, functions, conditions, events and DOM changes.
- ☑ Create a test plan.
- ☑ Create the GitHub repository and README outline.

Required evidence

- ☑ Problem statement and requirements.
- ☑ Wireframe or page sketch.
- ☑ Planned data structure and logic.
- ☑ Test plan.
- ☑ Repository link.

Competency criteria

- ☑ Scope is appropriate for a beginner project.
- ☑ Requirements are clear and testable.
- ☑ Plan covers required JavaScript concepts.
- ☑ Evidence shows approval before full build.

Learner Activity Record

Date started	2026/07/20
Date completed	2026/10/08
Location / platform	RedPanda Software
Time spent (hours)	4 Hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM-04\4.1-ProjectPlanningAndDesign\ProjectPlan.docx
Challenges experienced	Layout of the HTML Page
How challenges were resolved	

Learner Reflection

What did you complete in this activity?

Completed the HTML and adding links to the CSS and JavaScript file.

Planned a project layout for the Project.

Which JavaScript concepts did you apply?

None.

What worked well?

Page was setup correctly.

What error or difficulty did you encounter?

None.

How would this skill be useful in a retail or workplace environment?

Able to structure and plan an HTML Page.

Facilitator / Assessor Verification

Activity 4.2: Project Build and Version Control

Purpose of the Activity
Build the selected project progressively and record changes.

Instructions to the learner

- ☑ Create a working HTML structure and CSS layout.
- ☑ Implement input and validation.
- ☑ Use JavaScript functions and decision logic.
- ☑ Use an array or object where relevant.
- ☑ Use DOM manipulation and events.
- ☑ Create meaningful commits and at least one branch or pull request.
- ☑ Keep code readable and commented. **Required evidence**

- ☑ Final source files.
- ☑ GitHub repository.
- ☑ Commit history.
- ☑ Branch or pull-request evidence.
- ☑ Screenshots of major features. **Competency criteria**

- ☑ Core requirements are implemented.
- ☑ JavaScript concepts are applied correctly.
- ☑ Project remains within approved scope.
- ☑ Version-control history is authentic and progressive.

Learner Activity Record

Date started	2026/07/20
Date completed	2026/10/08
Location / platform	RedPanda Software
Time spent (hours)	8 Hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM-04\pm04-final-project\evidence
Challenges experienced	Variable scopes
How challenges were resolved	Adding comments on code snippets

Learner Reflection

What did you complete in this activity?

Completed linking the CSS and JS files to the HTML.

_____

Which JavaScript concepts did you apply?

Variables, Functions, DOM, events and Conditions

What worked well?

Using DOM to push and create new elements on the HTML Page.

What error or difficulty did you encounter?

Getting the variables scopes done correctly.

How would this skill be useful in a retail or workplace environment?

Helping you navigate through the code a lot easier.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action
Core requirements are implemented.	☐	☐	
JavaScript concepts are applied correctly.	☐	☐	
Project remains within approved scope.	☐	☐	
Version-control history is authentic and progressive.	☐	☐

Activity 4.3: Project Testing, Debugging and Improvement

Purpose of the Activity
Test the project systematically and correct defects.

Instructions to the learner

- ☑ Test each functional requirement.
- ☑ Test invalid, empty and boundary inputs.

- ☑ Record expected versus actual results.
- ☑ Use Developer Tools to investigate failures.
- ☑ Correct defects and retest.
- ☑ Record at least one improvement made after testing. **Required evidence**

- ☑ Completed test report.
- ☑ Debugging screenshots.
- ☑ Defect/fix record.
- ☑ Updated code and commits. **Competency criteria**

- ☑ All main requirements are tested.
- ☑ Defects are described and corrected.
- ☑ Retesting confirms fixes.
- ☑ Evidence supports the final quality of the project.

Learner Activity Record

Date started	2026/08/20
Date completed	2026/10/08
Location / platform	8 Hours
Time spent (hours)	RedPanda Software
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training
Evidence file names	PM-04\pm04-final-project\evidence
Challenges experienced	None
How challenges were resolved	N/A

Learner Reflection

What did you complete in this activity?

Completed test report, Debugging and fixing errors.

_____

Which JavaScript concepts did you apply?

Variables, Functions, DOM, events and Conditions

_____

What worked well?

Validations on text and email fields worked well.

_____

What error or difficulty did you encounter?

None.

_____

How would this skill be useful in a retail or workplace environment?

Layout structure is easy to follow.

Facilitator / Assessor Verification

Activity 4.4: Final Demonstration, Presentation and Reflection

Purpose of the Activity
Present the completed project and explain how JavaScript was used.

Instructions to the learner

- ☑ Demonstrate the main user flow.
- ☑ Explain HTML, CSS and JavaScript responsibilities.
- ☑ Explain at least three JavaScript concepts used.
- ☑ Show GitHub evidence.
- ☑ Discuss one challenge, one limitation and one future improvement.
- ☑ Submit the final reflection. **Required evidence**

- ☑ Presentation or demonstration evidence.
- ☑ Final screenshots.
- ☑ Final reflection.
- ☑ Facilitator/assessor observation record.
- ☑ Final repository link. **Competency criteria**

- ☑ Project runs and is demonstrated confidently.
- ☑ Learner explains the solution accurately.
- ☑ Evidence is complete and organised.
- ☑ Reflection identifies meaningful learning and improvement.

Learner Activity Record

Date started	2026/08/20
Date completed	2026/10/08
Location / platform	RedPanda Software
Time spent (hours)	8 Hours
GitHub repository / link	https://github.com/Ryan-skully/redacademy_javascript_training

Challenges experienced	None
How challenges were resolved	N/A

Learner Reflection

What did you complete in this activity?

The project for PM04.

Which JavaScript concepts did you apply?

Variables, Functions, DOM, events and Conditions.

What worked well?

Everything was seemless.

What error or difficulty did you encounter?

None.

How would this skill be useful in a retail or workplace environment?

Working concept of a resource form.

Facilitator / Assessor Verification

Criterion	Competent	Not Yet Competent	Comments / corrective action

PM-03	**12**	Competent / Not Yet Competent			
PM-04	**12**	Competent / Not Yet Competent			

Integrated Practical Completion Declaration

The undersigned confirm that the learner's practical evidence has been reviewed against the applicable practical module requirements and provider assessment instruments. Any outstanding gaps, reassessments or conditions are recorded in this logbook.

Learner name and signature	Ryan Christopher Ward 
Facilitator / mentor name and signature	Mr Mahomed H. G Nabee
Registered assessor name and signature	Mr Mahomed H. G Nabee
Moderator / quality reviewer name and signature	
Employer / workplace representative (where applicable)	
Final completion date	

Reference and Governance Note

This logbook was developed with reference to QCTO guidance that occupational and skills programmes are workplace- and practice-oriented, that providers assess and record results for knowledge and practical modules, and that assessment evidence must support judgements of learner achievement. The exact implementation must remain consistent with the registered curriculum, provider accreditation scope, assessment policy, applicable Quality Partner/SETA requirements and any approved learning-material matrix.
